This catalogue summarizes the 40 Academia-Industry connections, as displayed in Table 1. Here you find the number of connection (#), the corresponding video factsheets (VFS) from Industry and Academia, with a link to the video number, the market niche, a short description of the connection, a description of the innovation it's market traction.

Table 1. The 40 Academia-Industry connections.

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
1	67 Recycling mixed plastics into products	51 Plastic waste to nanocarbons	Renewable Energy with AI	The academic offer addresses the industry partner's innovation goals by integrating AI-driven analysis to optimize renewable energy efficiency and decision-making, directly tackling the sustainability challenges identified in the industry challenge.	Transforming hard-to-recycle plastic waste—which typically ends up in landfills or incinerators—into advanced, high-value materials introduces a highly disruptive paradigm for the circular economy. This technological innovation shifts the market away from basic mechanical downcycling toward sophisticated chemical and material upcycling. By utilizing optimization models guided by artificial intelligence, the system precisely tunes reaction conditions, yield quality, and energy efficiency, allowing businesses to convert raw plastic waste into aesthetic, durable design panels or high-grade nano-carbon materials (such as carbon nanotubes and graphene-like structures) for energy storage applications.	Growing global demand for advanced carbon materials in the clean energy and electronics sectors, combined with the furniture and construction industries' need for sustainable raw materials, unlocks extensive commercial opportunities. Manufacturing scaling and the industrialization of the initial waste-transformation phase are actively accelerated by connecting innovative enterprises with academic research teams specialized in mechanical engineering and materials science. Collaborating on scalable process lines while engaging local communities in classifying specific plastics helps overcome market barriers linked to variable input quality and stringent European environmental frameworks, effectively restoring public trust and credibility in green manufacturing systems.
2	69 Psychology-informed cybersecurity tools	10 Privacy first security learning	AI-Enhanced Cybersecurity	The academic offer provides a direct technical response to the industry's demand for novel AI-driven cybersecurity tools, utilizing a high level of domain expertise to ensure the resilience of both individuals and enterprises.	Combining open-source intelligence, generative artificial intelligence, and behavioral science establishes a highly disruptive paradigm within the cybersecurity training sector. This technological architecture shifts the market by replacing static, generic awareness campaigns with highly realistic, simulated spear-phishing exercises tailored to each individual's context. By mimicking the mindset and strategies of a real attacker, the system	The increasing sophistication of cyber threats alongside rising demand from public institutions, critical sectors, and businesses for adaptive defense mechanisms secures this personalized platform a powerful commercial potential. The development and real-world deployment of functional prototypes across small and medium-sized enterprises (SMEs) are significantly accelerated by academic cooperation. Partnering with university researchers to conduct user impact studies and proof-of-concept testing allows for the creation of robust ethical and privacy frameworks,

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
					dynamically scales its difficulty based on user profiles, transforming corporate defense from passive compliance into genuine, human-centred resilience against social engineering.	helping companies successfully overcome user acceptance barriers and navigate strict European data protection regulations.
3	13 AI readiness navigator tool	35 AI-driven cybersecurity and the need for frameworks to assess risk and readiness.	AI-Enhanced Cybersecurity	The academic offer provides structured joint development methodologies that assist the industry partner in distilling complex socio-technical AI variables into a practical decision-making tool for cost-benefit analysis.	Developing a strategic tool for comprehensive AI evaluation (AI Readiness Navigator) introduces a highly disruptive paradigm for organizational digital transformation. This innovation shifts the market away from merely tracking short-term financial returns or technical feasibility toward multi-dimensional risk assessment. The system combines advanced models of human-machine collaboration with deep analysis of hidden economic risks, social and environmental impacts (carbon footprint), and cybersecurity, enabling managers to make responsible and sustainable decisions before adopting AI.	Growing pressure for regulatory compliance with EU policies and the urgent need for large corporations and the public sector to minimize unforeseen costs and reputational risks secure this methodology a powerful position in the market. Commercial deployment and final software development are actively accelerated through a co-design methodology that directly connects academic researchers with practitioners from regulated industries like finance and healthcare. This close partnership integrates multidisciplinary ESG (Environmental, Social, and Governance) frameworks, helping businesses successfully navigate the high complexity of risk modelling and build long-term public trust in deployed technologies.
4	70 AI software for medical screening	70 Biobanking, data sharing	Personalized health	This pairing creates a viable foundation for the grant project by integrating digital diagnostic innovation with the high-demand laboratory capabilities required for both cancer research and practical therapy validation.	The researcher's extensive biobanking network represents a completely disruptive innovation that offers high potential to co-create entirely new predictive markets and value propositions in personalized medicine. This potential is fully realized by the specific match with the company's AI capabilities, which directly overcomes scaling and regulatory bottlenecks by bridging the gap between software prototyping and commercial product readiness.	The company's demand establishes a completely disruptive level of market traction by aiming to transform consumer behavior and healthcare delivery from reactive treatments to proactive, mass pre-symptomatic disease screening. This projected market adoption is strongly enhanced by the specific match, which provides the massive volume of pathologically validated clinical samples necessary to validate the company's cost-reducing diagnostic software.

Funded by the European Union

Funded by the European Union under the Grant Agreement No. 101131728. #	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
5	33 Menopause support and monitoring app	27 Innovation in emerging health technologies	Personalized health	This pairing creates a viable foundation for the grant project by grounding a high-impact, community-focused health initiative in disruptive predictive technology to move beyond "simplistic" interventions toward proactive, clinical-grade wellness monitoring.	The researcher's offer represents a highly disruptive medical innovation by developing an AI-powered platform capable of identifying asymptomatic increases in allostatic stress load weeks before clinical symptoms appear. This disruptive potential to co-create new wellness value propositions is significantly strengthened by the match with the company's regional digital health ecosystem, which provides the targeted localized user engagement and software deployment frameworks required to bypass traditional healthcare delivery bottlenecks.	The company's demand establishes a transformative level of market traction by introducing a culturally tailored, gamified platform designed to fundamentally pivot user behavior toward long-term, proactive preventative health management. This projected market adoption is strongly accelerated by the specific match, as the researchers clinically validated physiological data structures provide the necessary scientific credibility to convert an underserved population into active, risk-reducing consumers.
6	50 Nutritional protocol validation	67 Metabolism, bioactivity testing	Personalized health	This pairing creates a viable foundation by anchoring the industry's "farming as a service" model in rigorous nutrition science and digestive health validation, addressing the industry's previous lack of technical clarity.	The researcher's offer represents a completely disruptive biomedical innovation by providing an extensive, certified network of over two million biological samples alongside comprehensive multiomics clinical datasets. This disruptive potential to co-create entirely new markets in personalized healthcare is fully unlocked by the specific match with Aptosmart's AI demand, which directly overcomes complex European regulatory hurdles and software scaling constraints by leveraging certified data structures and custom prospective sample collections to move prototypes into market-ready diagnostic products.	The company's demand drives completely disruptive market traction by introducing high-efficiency AI software designed to fundamentally shift healthcare delivery from late-stage treatments to massive, early-stage pre-symptomatic disease screening. This projected market adoption is strongly accelerated by the specific match, as the researchers pathologically validated human specimens provide the definitive clinical validation required to prove the cost-reducing capabilities of the diagnostic software and secure widespread clinical trust.

Funded by the European Union

Funded by the European Union under the Grant Agreement No. 101131728. #	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
7	63 Hospital quality management platform	31 Data-driven approaches support patient-specific medical decisions	Personalized health	Combining practical healthcare management with data-centric innovation, effectively bridging the gap between routine process improvement and advanced, tailor-made medical solutions.	The researcher's clinical AI tool introduces a completely disruptive healthcare paradigm by automatically transforming routine medical checkups into individualized, predictive diagnostic guidance. This high disruptive potential is fully unlocked by the match, as integrating these automated early-warning algorithms directly into the company's process-mapping platform resolves critical data-access and workflow bottlenecks across hospital shifts.	A profound shift in administrative and medical behavior is established by the company's demand to unify fragmented hospital quality management systems into a single mobile platform. This projected market adoption is significantly accelerated through the specific partnership, which reduces routine physician checkup times from thirty minutes to under seven minutes to deliver the massive, undeniable efficiency gains required for rapid clinical deployment.
8	20 AI patient monitoring and alerts	9 Disease progression AI predictor	Personalized health	The academic offer provides the AI-based predictive models and biomarker image analysis necessary to transform the industry partner's monitoring solution into a proactive clinical tool for tracking patient status between visits.	A maximum level of disruptive innovation is achieved by merging predictive AI algorithms with a multi-vital sign monitoring wearable. This synergy completely transforms reactive, episodic hospital checkups into a continuous, proactive diagnostic safeguard that automatically detects patient deterioration before clinical symptoms appear.	Market traction reaches peak potential by directly addressing severe nurse burnout and the critical need for automated clinical data logging. Widespread commercial adoption is strongly accelerated by integrating fifteen years of medical data expertise, providing the definitive validation needed to bypass strict European regulatory and data privacy barriers.
9	18 AI-based mental longevity platform	20 Co-create a human-centred prediction and monitoring environment for personalized	Personalized health	High-precision AI diagnostics for stroke prediction and rehabilitation, offering a specialized medical utility that enhances the industry partner's health information platform for the aging population.	A maximum level of disruptive innovation is unlocked by feeding data from a virtual reality mindfulness and cognitive therapy platform into advanced machine learning prognosis pipelines. This unique match shifts geriatric care by turning immersive behavioral therapies into structured data sources for digital twins, predicting patient outcomes long before clinical decline sets in.	Market traction reaches peak potential by directly tackling the massive healthcare burden of aging European populations and solo-living elderly citizens. Widespread commercial adoption is strongly accelerated through multi-site deployment frameworks and shared data-anonymization workflows, which build user trust and quickly bypass strict clinical validation bottlenecks.

Funded by the European Union

Funded by the European Union under the Grant Agreement No. 101131728. #	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
		patient and staff support in hospitals				
10	21 Selenium-based sepsis treatment	70 Biobanking, data sharing	Personalized health	Specialized ultra-low temperature storage for biological samples, which serves as a critical infrastructure component for managing the specific biomarkers and clinical specimens required for advanced sepsis and septic shock treatment research.	A maximum level of disruptive innovation is achieved by mapping the company's unique redox-potential therapeutic approach against a massive national biobanking network. This synergy completely alters the sepsis treatment paradigm by using pathologically validated human tissues to transition from traditional protein-receptor targeting to full cellular fluid environment modification.	Commercial traction reaches peak potential by directly addressing critical ICU mortality and the multi-billion-dollar unmet medical burden of septic shock. The partnership strongly accelerates market readiness by leveraging over twenty types of ethically certified clinical specimens, directly bypassing traditional, slow pre-clinical validation bottlenecks.
11	17 AI sports injury prevention	6 Digital health platform for non-hospital environments	Personalized health	Sophisticated AI predictive modelling and digital twin simulations that expand the industry partner's sports monitoring platform from basic injury prevention to comprehensive, data-driven health optimization.	A maximum level of disruptive innovation is unlocked by feeding continuous multi-sensor wearable data into interpretable causal machine learning pipelines. This unique match establishes a predictive sports medicine paradigm, transitioning amateur athletic recovery from retrospective treatment into simulation-driven digital twins that prevent reinjuries before physical strain occurs.	Commercial adoption reaches peak potential by directly targeting the high-cost burden of repeat injuries within Eastern European grassroots sports clubs. The partnership strongly accelerates market validation through joint pilot deployment frameworks, providing the necessary data-anonymization workflows to secure user trust and rapidly scale across regional athletic networks.

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
12	55 Bioactive nutritional supplements	24 Proactive personalized health	Personalized health	Proactive healthcare models to frame the industry partner's polyphenol application as a comprehensive preventative strategy against chronic diseases like Alzheimer's and cancer.	A maximum level of disruptive innovation is achieved by integrating predictive modelling of genetic, anthropometric, and lifestyle data directly into functional food development. This unique match completely shifts the nutraceutical industry from generic supplementation to personalized functional snacks featuring microencapsulated polyphenols that mask bitterness and optimize bioavailability according to individual biological profiles.	Commercial adoption reaches peak potential by directly addressing massive consumer demand for scientifically backed palatable products that prevent chronic diseases. This market deployment is strongly accelerated by academic cross-disciplinary database integration, providing the vital biological validation needed to overcome high technical and financial barriers in active formulation stability testing.
13	59 AI-driven employee wellness tools	8 Predictive disease risk	Personalized health	Domain Adaptation Framework and meta-learning architecture that can be repurposed to handle the diverse "domain shifts" in employee stress data, ensuring the industry's mental coaching AI remains accurate across different workplace environments and populations.	A maximum level of disruptive innovation is achieved by merging advanced risk-assessment artificial intelligence with employee well-being and productivity software. This synergy completely redefines corporate human resources by transforming traditional reactive talent management into a proactive paradigm capable of forecasting emotional strain and burnout before it impacts organizational health.	Market traction reaches peak potential by directly addressing severe workplace stress affecting up to 60% of modern employees. Commercial adoption is strongly accelerated by integrating fifteen years of academic data-processing expertise, providing the definitive methodology needed to overcome strict European regulatory and personal data privacy barriers.
14	4 Automated drone flight-planning	46 Expertise in UAV system validation and testing	Drone Delivery Service	Aligning critical drone delivery service needs with a research group capable of ensuring the safety and regulatory compliance of autonomous flight control systems.	Developing a fully automated air traffic management and flight routing system for unmanned aerial vehicles (UAVs) introduces a highly disruptive paradigm for logistics and autonomous aerial mobility. This innovation directly addresses the complete absence of aerospace control automation, which has historically constrained widespread drone deployment, by introducing advanced	Unlocking entirely new commercial avenues in Industry 4.0 provisioning, parcel delivery, and night operations within complex environments secures this platform a global competitive edge across a wide spectrum of European operators. Commercial scaling—projected to reach its full market potential within a three-year horizon—is actively accelerated by uniting industry leaders with multidisciplinary academic teams specialized in embedded control systems and

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
					algorithms for obstacle detection, environmental perception, and energy-efficient mission planning. The result is a comprehensive software architecture capable of dynamically accounting for real-time air traffic density, weather conditions, and strict regulatory restrictions, shifting the market away from manually coordinated flights toward a secure, fully autonomous ecosystem for delivery services.	aerospace engineering. This close collaboration in co-developing prototypes, integrating new payloads, and validating concepts under realistic conditions allows businesses to successfully navigate technical hurdles and stringent international regulatory barriers while ensuring maximum operational safety.
15	3 High-tech drone landing points	64 Transport of medical supplies using drones	Drone Delivery Service	This pairing creates a viable foundation for the grant project by combining the industry's market-driven innovation with an academic partner capable of navigating the complex regulatory feasibility and technical deployment constraints of the Integrated Rescue System.	Integrating specialized drone delivery networks into existing medical and emergency infrastructure introduces a highly disruptive paradigm for autonomous logistics and public safety. This innovation addresses the historical unpredictability and diversity of drone unloading zones—such as high-rise balconies, private yards, or crowded public spaces—by embedding automated thermal image processing and intelligent payload drop-off mechanisms. This architecture shifts emergency supply chains from manual transit to an automated aerial grid, capable of rapidly delivering critical equipment like automated external defibrillators (AEDs) to first responders and the general public.	Drastically accelerating delivery times for time-critical emergency cargo opens unexploited commercial sectors completely free of traditional market competition. Commercial scaling and operational testing are significantly expedited by joining forces with university teams who possess the facilities to validate cutting-edge software and hardware directly within live emergency response simulations. Furthermore, this close academic-industry cooperation allows partners to co-author entirely new operational frameworks where current laws remain vague, helping businesses stay ahead of evolving EU legislation and successfully bypass strict regulatory barriers to ensure legally compliant deployment.

Funded by the European Union

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
16	23 Smart Building Management System (BMS)	21 AI-powered smart Building Management System	AI-Powered Energy Consumption Analysis	A clear, low-cost framework for fine-grained, room-by-room thermal regulation that perfectly complements the industry's original 3-day predictive air quality and heating model.	Developing a low-cost, GPU-integrated Building Management System (BMS) introduces a highly disruptive paradigm for smart property operations. This architecture replaces traditional, cost-prohibitive computing infrastructure—which frequently costs around €50,000—with an affordable solution capable of executing lightweight AI models directly on edge devices to automatically optimize indoor air quality, heating, and cooling.	Democratizing energy efficiency for small municipalities, SMEs, and minor industrial facilities unlocks a massive, previously underserved market sector. Commercial adoption is strongly accelerated by blending predictive algorithms with automatic data-cleaning filters to overcome hardware limitations and sensor noise, helping clients achieve strict European Commission sustainability compliance without heavy upfront investments.
17	1 AI battery degradation prediction	43 Expertise on battery systems and validation	AI-Powered Energy Consumption Analysis	Specialized testing and validation methodologies for accelerated battery aging, directly addressing the industry's need for refined predictive models for State of Health.	Repurposing decommissioned electric vehicle batteries into stationary energy storage systems establishes a highly sustainable, second-life market paradigm. This approach introduces a massive shift in battery diagnostics by combining instant state-of-health snapshots with advanced, accelerated validation methodologies. By simulating real-world environmental conditions and bypassing manufacturer communication blocks to test cells directly, this framework accurately uncovers hidden chemical degradation—such as latent dendrite growth caused by past extreme temperatures—without requiring long, drawn-out testing cycles.	Giving commercial and utility buyers the exact predictability they need to guarantee their investment returns unlocks substantial market trust in second-life applications. Commercialization is strongly accelerated by establishing automotive research partnerships to develop standardized testing methods that preserve identical degradation mechanisms across multiple battery models. This collaborative prototyping directly mitigates data scarcity from original manufacturers, drastically reducing the carbon impact of battery production and boosting cost-efficiency across the power grid.
18	25 Micro-mobility optimisation platform	42 Mobility research centre with wide range of	Sustainable Mobility Hubs	The academic offer provides a broad portfolio of specialized skills and addressable topics that can help clarify the industry	Creating a unified digital platform to manage sustainable Mobility Hubs introduces a highly disruptive paradigm for urban transportation, specifically tailored for mid-sized and interconnected cities. This innovation shifts the market away from	Democratizing advanced smart mobility and making it accessible to previously underserved regional communities unlocks massive commercial potential, targeting a 25% reduction in urban CO2 emissions and a 40% increase in shared mobility adoption across partner cities. Commercial scaling is actively

		research activities		partner's technical and business maturity while bridging the feasibility gap for their urban lab solution.	fragmented shared-service systems by establishing an integrated digital twin architecture. By combining vehicle telematics, smart passenger-counting sensors, and onboard artificial intelligence directly within micro-mobility assets (e-bikes, scooters, and micro-cars), the system enables autonomous local decision-making and data-driven multimodal route optimization based on real-world behavioral patterns.	accelerated by collaborating with top-tier automotive technology canters and academic research labs to develop predictive maintenance and demand-forecasting algorithms. Furthermore, co-developing advanced mobility simulators allows partners to test and validate mathematical models through live field experiments, giving municipalities rigorous social and environmental impact analyses before deploying full fleets.
19	24 Peer-to-peer vehicle sharing platform	18 AI-based workflow and urban vision system	Sustainable Mobility Hubs	Specialized technical competencies in AI and data fusion that transform the industry's established urban micromobility solution into a disruptive, data-driven "Blue Ocean" strategy.	Combining peer-to-peer (P2P) vehicle sharing with advanced computer vision and synthetic data models introduces a highly disruptive paradigm for flexible urban and regional mobility. This technological architecture replicates an "Airbnb for cars" model and enhances it with deep learning. Implementing automated AI pipelines for visual infrastructure monitoring and real-time bottleneck detection shifts the market from simple digital rental matchmaking to a highly secure, fully transparent, and predictive ecosystem for sharing private and corporate fleets.	Eliminating traditional car rental barriers—such as hidden fees, unstable pricing, and rigid availability—ensures immediate market appeal for this solution, as demonstrated by over 25,000 app downloads in pilot regions. International scaling and technological evolution are actively accelerated by engaging university research teams to develop innovative insurance policies and advanced algorithms. Furthermore, utilizing Generative Adversarial Networks (GANs) for synthetic data generation allows for the training of robust AI models even under data-scarce conditions, helping businesses successfully navigate strict privacy regulations and guarantee a superior customer experience.
20	39 Thermal energy storage systems	50 Decentralized Renewable energy systems generation	Decentralized Renewable Energy	The academic offer addresses the industry's demand for carbon removal by providing the advanced power electronics and real-time energy management systems	Integrating a highly insulated seasonal thermal storage system with advanced control algorithms for decentralized microgrids introduces a highly disruptive paradigm shift for emission-free building insulation and climate control. This technological configuration makes it possible to entirely capture surplus solar	Radically reducing energy costs for households without placing any negative stress on the stability of the electric grid ensures this solution an exceptional commercial position, particularly across Central and Northern Europe. Commercial deployment and early prototype validation are strongly accelerated by establishing academic partnerships to translate advanced power electronics simulation models into

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
				necessary to stabilize the multi-source microgrids that power such energy-intensive operations.	energy during the summer, store it securely in a large-capacity thermal battery, and deploy it in the winter to fully cover the heating season of an average family home. Integrating these components with real-time multi-source energy management strategy removes all reliance on grid electricity or fossil fuels, optimizing the entire hybrid system under realistic operating conditions.	real-world applications. This close collaboration enables deep feasibility analyses prior to physical installation, helping businesses anticipate and overcome non-technical infrastructure and administrative market barriers, such as delayed construction permits or complex grid integration.
21	42 Humic acid production from CO_2	54 Connecting AI and energy systems	Conversion of Waste CO2	The NDIS Research Centre's multidisciplinary tools and modernization expertise provide the technical framework necessary to integrate the complex capture and transformation of CO2 into humic acids.	hefting away from the massive capital expenditures and logistical bottlenecks of traditional Carbon Capture and Storage toward an innovative biological-chemical transformation of CO2 introduces a highly disruptive paradigm for industrial and agricultural decarbonization. Instead of relying on energy-intensive gas purification and permanent underground pipeline injection, this architecture stabilizes captured carbon directly into the soil. By combining raw CO2 emissions with lignocellulose, the system synthesizes high-grade humic acids to serve as an eco-friendly soil amendment—offering a highly scalable, economically viable alternative that enhances crop yields while permanently locking away carbon. Integrating these processes with advanced industrial digitalization further bridges artificial intelligence research with domain-specific engineering to fully optimize the lifecycle of emission conversion.	Surging penalties on industrial emitters coupled with the agricultural sector's urgent demand for sustainable, non-coal-derived soil stabilizers secure this hybrid technology a massive, unexploited commercial market. Commercial validation and the smooth transfer of academic discoveries into market-ready industrial assets are actively accelerated by working alongside multidisciplinary university laboratories. These research teams bring valuable expertise in predicting technical energy losses and managing digital systems. This close institutional cooperation successfully dismantles traditional communication barriers and academic silos, allowing industrial partners to rapidly co-develop and validate functional decarbonization prototypes directly within live production environments.

Funded by the European Union

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
22	30 Synthetic fuels from CO_2	2 CO_2 conditioning integration for industrial emitters	Conversion of Waste CO2	This pairing secures the project's technical feasibility by combining a large-scale industrial decarbonization vision with the specialized academic capability needed to meet strict chemical purity specifications.	Shifting away from traditional carbon capture and storage toward the direct refining and synthesis of carbon dioxide into sustainable e-fuels introduces a highly disruptive paradigm for the decarbonization of heavy industry and aviation. This innovation addresses critical limitations in current CCUS (Carbon Capture, Utilization, and Storage) models, which frequently suffer from high energy requirements and low-purity gas streams captured from cement plants or refineries. The new architecture replaces these processes with an eco-friendly and less energy-intensive conversion technology centred around syngas (CO and H2). By accurately modelling real-world flue gas compositions, the system transforms waste CO2 into drop-in synthetic fuels (e.g., via Fischer-Tropsch synthesis), shifting the market from passive emission storage to a fully functional circular carbon economy.	Surging pressure to comply with the European Renewable Energy Directive (RED) and urgent demand from the aviation and petrochemical sectors for affordable, sustainable e-fuels unlock a massive commercial market across Central Europe. Industrial scaling and the design of first-of-its-kind pilot plants are actively accelerated by connecting energy leaders with academic centers specializing in chemical process engineering and techno-economic simulation. This close institutional cooperation allows for model validation using live industrial flue gas datasets rather than generic synthetic data. Consequently, partners can successfully navigate strict corporate confidentiality protocols and the current lack of standardized European CO2 purity guidelines by co-creating custom purity specifications tailored directly to the final product requirements.
23	6 AI detection of PRM parking	22 Visual and sensor data for smart cities	AI & IoT for Smart Cities	This pairing establishes a viable foundation by aligning specific industrial mapping needs with academic capabilities to scale social impact through proven problem-solving strategies.	Deploying advanced computer vision models onto satellite and street-view imagery creates a highly disruptive urban planning paradigm. This synergy completely alters how cities manage accessibility by replacing slow, unscalable municipality data collection with weak-supervision AI pipelines that automatically identify and validate restricted parking spaces in real time.	The unmet mobility needs of over fifteen million European disabled parking card holders give this solution massive commercial potential. Rapid cross-border scaling is strongly accelerated by integrating specialized labelling strategies that maintain model stability across unpredictable weather, varying camera quality, and urban visual clutter.

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
24	5 Autonomous vehicle navigation	4 Hybrid deep learning localization system	AI & IoT for Smart Cities	The academic offer provides the necessary technical oversight to address the current lack of explained feasibility, ensuring the initiative's innovative features are backed by a sound scientific methodology.	Integrating lightweight deep learning models into existing robotic architectures creates a highly disruptive autonomous navigation paradigm. This synergy shifts the industry standards by enabling real-time camera localization, mapping, and intelligent perception directly on edge devices, completely bypassing the traditional need for heavy, expensive computing infrastructure.	Commercial deployment potential scales rapidly by introducing a highly adaptable 3D localization framework tailored for smart city applications. Market readiness is strongly accelerated through joint research and development initiatives, allowing companies to quickly validate autonomous mapping software while managing tight delivery deadlines and limited hardware resources.
25	56 AI-driven accessibility solutions	69 Smart cities for persons with disabilities	AI & IoT for Smart Cities	The academic offer provides the AI and IoT expertise necessary to implement the data-driven monitoring and decision support systems required by the industry's identified market niche.	Developing an all-in-one AI platform that combines automated website monitoring, real-time compliance tracking, and training creates a highly disruptive digital accessibility framework. This approach transforms the industry by replacing slow, expensive manual auditing with automated pipelines that dynamically handle complex websites and PDF documents without requiring dedicated IT departments.	Strict legal mandates from the European Accessibility Act drive massive commercial adoption as organizations face heavy administrative penalties for non-compliance. Scalability is strongly accelerated by integrating academic software architecture expertise, allowing the platform to dynamically monitor hundreds of complex websites simultaneously while meeting global data privacy standards.
26	46 AI logistics optimization	41 Mobility research centre with wide range of research activities	AI & IoT for Smart Cities	The academic offer provides the specialized technical capacity and entity-level capabilities required to operationalize ParcelP's disruptive carbon-neutral logistics innovation.	Introducing a parcel layer onto real-time freight marketplaces establishes a highly disruptive paradigm for cross-border logistics. This approach completely shifts industry standards by utilizing empty or half-empty trucks that are already on the road, entirely eliminating the need to build dedicated delivery fleets while unlocking inherently carbon-neutral shipping.	Slashing cross-border parcel delivery costs by 50% to 95% while counteracting rising e-commerce emissions gives this solution an immediate commercial edge. Market deployment across Europe is strongly accelerated by integrating with advanced smart mobility ecosystems, allowing small and medium enterprises to seamlessly connect and rapidly scale shipping services through regional automotive hubs.

#	VFS Industry	VFS Academic	Niche	Short description of the connection	Disruptive innovation	Market traction
27	48 AI and digital twin analytics	44 Data collection expertise for mobility sector	AI & IoT for Smart Cities	The academic offer provides a direct technical match for the multi-domain innovation needs identified by the industry partner, ensuring all R&D gaps are addressed through specialized expertise.	Transforming raw monitoring data from IoT sensors into immediate predictive insights establishes a highly disruptive paradigm for critical infrastructure management. This approach bridges urban systems and the agri-food supply chain into a single learning platform, automatically detecting anomalies to prevent equipment failures and food waste before any damage occurs.	Operating across more than 10,000 actively deployed data points gives this solution an exceptionally robust commercial validation and proven scalability. Market readiness and predictive algorithm deployment are strongly accelerated through integration into an active smart mobility Living Lab, facilitating large-scale testing of decision support systems within a real-world city ecosystem
28	43 Air-quality improvement technology	66 Metropolitan control centre, automatic evaluation of video recordings and audio sensors	AI & IoT for Smart Cities	The academic offer provides the AI and IoT technical framework necessary to transform the industry's early-stage concept into a sophisticated, data-driven smart city application focused on urban efficiency.	Applying photocatalytic coatings with exceptional efficiency introduces a highly disruptive approach to urban environmental protection. This technology completely changes current maintenance practices because simply coating interior and exterior building surfaces autonomously purifies the air from harmful pollutants, removes mold and algae, and cleans water, entirely removing the need for costly mechanical upkeep.	The pressing demand to improve long-term urban quality of life and lower municipality maintenance costs gives this ecological solution massive commercial potential. Market deployment is strongly accelerated through potential integration with established metropolitan dispatch centers, which use smart environmental sensors to continuously monitor air quality, providing the exact long-term data needed to validate the coating's real-world impact at scale.
29	15 AI-powered automation software	57 Urban driving to public municipalities	AI & IoT for Smart Cities	This pairing creates a viable foundation by utilizing the university's deep expertise in organizational strategy and ethical AI to provide the niche-specific technical specification currently missing from the industry's service-led proposal.	Automating work activity analysis through AI-powered camera systems introduces a highly disruptive shift in business process optimization. This technology entirely eliminates the need for employees to manually log their tasks or repeatedly input identical information into multiple systems. Connecting these autonomous workplace tools with public service data platforms creates a comprehensive ecosystem that redefines the role of public authorities and corporate managers from reactive to proactive, responding instantly to actual	Strong corporate demand for software that offers genuine process simplification rather than merely adding unhelpful product layers ensures this solution a powerful market position. Commercial deployment and platform development are greatly accelerated by establishing joint ventures with universities, allowing companies to absorb the technical know-how of ambitious researchers. Furthermore, this academic partnership provides the vital methodological foundation required to comply with strict individual data legislation, successfully managing regulatory and privacy-related market barriers.

					user needs without heavy administrative overhead.	
30	9 Car sensors for passenger wellbeing	49 Thermal and acoustic testing	AI & IoT for Smart Cities	The academic offer provides a specialized technical fit for the industry partner's identified market demand, directly filling the R&D gaps.	Turning a standard car into a proactive health guardian introduces a highly disruptive paradigm shift at the intersection of the automotive sector and smart cities. This innovation uniquely integrates advanced internal biometric sensors tracking driver well-being with external street-level environmental sensors monitoring noise and air quality. By feed-linking this data into predictive models of human metabolism and comfort perception, the system can dynamically recommend healthier driving routes or autonomously adjust the vehicle's microclimate, significantly reducing occupant fatigue and stress while optimizing energy consumption.	Generating completely new, lucrative revenue streams through premium subscription packages and the sale of anonymized environmental data to local governments gives this solution powerful commercial potential. Market deployment within automotive and public transport sectors is strongly accelerated by utilizing cutting-edge testing laboratories equipped with thermal and acoustic mannequins. These advanced simulations replicate human physiological responses to detect system weaknesses at very early design stages, enabling up to 17% in HVAC energy savings and successfully overcoming model stability barriers prior to manufacturing launch.
31	8 Safety certification for autonomous logistics	33 Sustainable cities capable of meeting future societal challenges	AI & IoT for Smart Cities	The academic offer provides concrete technical solutions and clearly presented skills that directly address the industry's identified pain points for urban and corporate environments.	Combining advanced autonomous robotic platforms with digital twin analytical models establishes a highly disruptive paradigm for urban logistics. This synergy shifts traditional courier models by introducing autonomous last-mile delivery robots capable of dynamically adapting to complex city layouts, moving the market away from	Strong corporate demand for massive delivery efficiency gains and enhanced urban sustainability gives this end-to-end configuration substantial commercial potential. Real-world deployment is actively accelerated by collaborating with academic researchers to validate prototypes and test predictive models within controlled and open test zones—such as university campuses, industrial parks, and ports. Furthermore, this collaborative approach is vital for building robust safety assessment frameworks,

					isolated technical fixes toward a fully integrated smart city architecture.	successfully managing the primary market barrier of fragmented European autonomous vehicle certification and regulatory legislation.
32	7 EU-wide PRM parking info with AI	38 Smart mobility, cybersecurity, and environmental sensing	AI & IoT for Smart Cities	The academic offer provides the well-defined institutional capacity and technical feasibility required to transition the industry partner's early-stage Generative AI concept into a functional system for EU regulation synthesis.	Combining advanced autonomous robotic platforms with digital twin analytical models establishes a highly disruptive paradigm for urban logistics. This synergy shifts traditional courier models by introducing autonomous last-mile delivery robots capable of dynamically adapting to complex city layouts, moving the market away from isolated technical fixes toward a fully integrated smart city architecture.	Strong corporate demand for massive delivery efficiency gains and enhanced urban sustainability gives this end-to-end configuration substantial commercial potential. Real-world deployment is actively accelerated by collaborating with academic researchers to validate prototypes and test predictive models within controlled and open test zones—such as university campuses, industrial parks, and ports. Furthermore, this collaborative approach is vital for building robust safety assessment frameworks, successfully managing the primary market barrier of fragmented European autonomous vehicle certification and regulatory legislation.
33	71 Nettle fibre sustainable production chain	65 Industrial use of nettles	Circular Agriculture and Packaging	The academic offer provides the specialized bioeconomy and circular economy expertise needed to develop UVECO's nettle innovation across high-impact sectors like composites, automotive, and construction.	Cultivating the common stinging nettle as a high-performance technical crop establishes a highly sustainable, circular raw material paradigm. This agronomic shift eliminates long-distance global textile transport and heavy chemical dependency by utilizing resilient local plants that simultaneously extract toxins from contaminated brownfields and post-mining zones through advanced phytoremediation, yielding incredibly durable fibres for the automotive, construction, and furniture industries.	Closing the gap between raw cultivation and high-volume industrial production unlocks an efficient, localized supply chain for bio composites and soundproofing panels. Commercial scaling is strongly accelerated by establishing dedicated demonstration farms and academic-industry intermediaries to verify fibre quality, helping businesses overcome low consumer awareness and manage complex multi-partner organizational hurdles.
34	72 Biodegradable	65	Circular Agriculture and	The academic offer provides the strong innovation potential and	Cultivating specific clones of the common stinging nettle on contaminated landscapes and post-mining zones introduces a highly	Growing demand from the automotive, construction, and furniture sectors for localized bio composites and soundproofing panels opens vast commercial avenues

	compost production	Industrial use of nettles	Packaging	circular economy principles required to elevate the industry project's sustainability goals into a concrete, market-ready application across sectors like construction and biogas.	disruptive paradigm for ecological restoration. This approach blends biodegradable waste processing and land reclamation with the natural phytoremediation capabilities of resilient crops that autonomously extract legacy pollutants from damaged soil. The result is a highly sustainable, circular loop where compromised land is successfully re-greened while simultaneously yielding exceptionally durable stem fibres for industrial applications.	for this circular solution. Market integration is actively accelerated by forming direct partnerships with mining companies and municipal authorities seeking cost-efficient methods to rehabilitate heavily burdened industrial land. Furthermore, engaging academic entities to establish dedicated demonstration farms guarantees consistent, high-quality fibre output, helping businesses overcome low consumer awareness and successfully manage complex, multi-partner organizational hurdles.
35	65 Sustainable spirulina cultivation	47 Biotechnology, circular and blue economy, algae	Circular Agriculture and Packaging	The academic offer provides the well-defined feasibility and technical capacity needed to structure the industry's microalgae innovation and clarify the specific operational changes required for its implementation.	Establishing a pilot microalgae cultivation plant that runs on a 100% energy- and water-independent loop introduces a highly disruptive paradigm for the circular economy. This proprietary automated configuration operates entirely off-grid and relies exclusively on rainwater harvesting. This approach allows for the clean extraction of high-value proteins and natural blue pigments (phycocyanin) from spirulina, driving the agri-food value chain away from high-emission practices toward carbon-neutral alternative proteins.	Surging global market interest in natural, clean-label ingredients and sustainable protein sources gives this biotechnological platform an immediate commercial edge. Scaling production capacity and lowering operational costs are actively accelerated by uniting with academic experts in innovation management to design larger facility layouts and optimized business models. Furthermore, this collaborative research network helps construct sound financial plans and secure international funding opportunities, successfully navigating the heavy capital barriers tied to scaling regenerative industrial solutions.
36	47 Advanced plant propagation	15 Green by-product valorisation	Circular Agriculture and Packaging	The academic offer provides established expertise in enzymatic hydrolysis, offering a technically mature process to meet the industry's fundamental	Transforming agri-food byproducts into bioactive ingredients introduces a highly disruptive paradigm shift for ecological farming and the circular economy. This innovation utilizes purely green enzymatic hydrolysis without any chemical solvents to revalorize waste biomass, while simultaneously introducing advanced	Ensuring high crop quality while remaining strictly economically attractive for farmers gives these ecological solutions an immediate commercial edge. Market deployment across the cosmetics, functional food, and animal health sectors is strongly accelerated by connecting laboratory research directly with industrial practice. Close cooperation between academic teams—who specialize in the in vitro

				biochemical processing requirements.	bacterial products and their metabolites that naturally enhance plant vitality and stress resistance. This combined approach radically minimizes dependency on synthetic agrochemicals, leading to the production of healthier, high-quality food with minimal chemical residues directly affecting human health.	application of these treatments on specific crop types—and dedicated engineering firms allows businesses to successfully navigate the technical barriers tied to the scale-up process from laboratory settings to large-scale industrial manufacturing.
37	52 Smart environmental management sensors	56 AI models for accurate heat-demand forecasting	Cross-niche: Circular Agriculture and Packaging & AI-powered Energy Consumption Analysis	The academic offer provides the AI-driven energy optimization and data-driven intelligence necessary to manage the complex power requirements of autonomous food cultivation in extreme, waste-free environments.	Developing a highly efficient, autonomous aeroponic system tailored for extreme and off-grid environments introduces a highly disruptive paradigm for urban agriculture and food security. This technological innovation removes dependence on external water and nutrient supply networks by integrating advanced separation membranes, atmospheric water generators, nozzle-free misting systems, and plasma-based nitrogen fixation into a single, self-managing unit. Combining these physical components with an intelligent layer of neural networks and machine learning algorithms shifts the market away from rigid, manually operated farming toward an adaptive circular architecture that can predict external factors and optimize resources in real time.	Enabling food production in locations where agriculture was previously unthinkable—ranging from arid regions and off-grid communities to humanitarian aid missions—unlocks extensive commercial niches in climate adaptation strategies. Commercial deployment, structured into phases from quick-win tests using historical data to full operational scaling, is actively accelerated by building long-term partnerships with university laboratories specializing in energy systems and predictive modelling. This close institutional cooperation and ongoing communication help industrial partners overcome complex barriers to accessing live IT infrastructure and operational data streams, allowing them to safely validate and regularly retrain artificial intelligence models directly within real-world operations.

38	19 Cognitive health for mobility safety	3 Preventive health technologies related to on-invasive muscle contraction analysis	Cross-niche: AI & IoT for Smart Cities & Personalized Health	This pairing creates a viable foundation by merging a highly creative, co-creation-ready industry vision with precise medical expertise in neuromuscular plasticity and cellular communication.	Combining predictive fleet optimization models with advanced non-invasive monitoring of the human factor introduces a highly disruptive paradigm for smart logistics and personalized health. This technological architecture shifts the market away from purely vehicle-centric management software toward a human-centric ecosystem that integrates real-time vehicle telematics, route morphology, and dynamic external conditions with the biological state of the driver. Implementing intelligent algorithms capable of assessing muscle fatigue through molecular biomarkers and electrophysical parameters enables a transition from reactive warnings to the predictive prevention of critical incidents—radically enhancing operational safety and driver efficiency.	Achieving up to a 30% reduction in energy consumption and CO2 emissions for existing commercial fleets while demonstrably protecting employee health unlocks extensive market opportunities across the logistics, public transit, and insurance sectors. Commercial scaling and the transfer of this technology from lab settings to the market are actively accelerated by forming strategic partnerships with technology enterprises and academic medical faculties. Co-developing comprehensive analytical systems, integrating physical strain-monitoring gadgets, and correlating extensive biological data with operational parameters allow partners to successfully navigate strict intellectual property protection (IPR) barriers and complex biomarker validation, ensuring high commercial value and long-term trust from industrial end-users.
39	2 AI decision tools for drone services	61 Energy conversion using AI, clean and sustainable transport	Cross-niche: Drone Delivery Services & Sustainable mobility hubs	The academic offer's comprehensive technological capacity in power electronics and electrified mobility provides the necessary R&D depth to operationalize the industry partner's innovative sector-specific idea.	Bridging advanced geospatial analytics with the intelligent engineering of power conversions and transport nodes (Mobility Hubs) introduces a highly disruptive paradigm for modern urban planning. This technological architecture shifts the market away from siloed, manual feasibility studies toward an AI-powered, integrated digital framework. Within a comprehensive digital twin environment, the platform enables the simultaneous site-selection, design, and optimization of clean mobility hubs—integrating hydrogen fast-charging networks and urban vertiports for drone cargo or passenger services directly with	Cutting infrastructure scoping and project preparation cycles by up to 50% while delivering data-driven ROI forecasts gives municipalities and private investors the confidence needed to accelerate groundbreaking on clean energy corridors. Commercial scaling and technology transfer are actively expedited by linking platform developers with academic research centers that feature certified laboratories for testing full-scale, high-voltage prototypes and embedded electronic hardware. This close institutional cooperation—facilitated through licensing agreements, contract research, and joint ventures—helps partners successfully overcome heavy sector workloads and

					high-performance power electronics, semiconductors, and smart distribution grids.	traditional industry silos, rapidly de-risking financial investments against uncertain future demand.
40	49 Algae agriculture technologies	4 Hybrid deep learning localization system	Cross-niche: Circular agriculture and packaging & AI & IoT for Smart Cities	This pairing creates a viable foundation by combining a mature, impact-oriented project with the academic rigor needed to substantiate the implementation strategy for its non-technological innovations.	Integrating closed bio-circular frameworks with lightweight localization algorithms built on hybrid deep learning introduces a highly disruptive paradigm for sustainable urban development and Smart City concepts. This innovation shifts the market away from conventional, computationally heavy, and energy-intensive urban management software toward self-managing ecosystems that seamlessly link the Internet of Things (IoT), intelligent environmental perception, and zero-waste food production. Embedding resource-efficient neural networks directly onto local robot or drone hardware enables precise, real-time spatial mapping and the optimization of multi-stage production lines—such as integrated aquaponic and algae systems that transform municipal or agricultural waste streams into clean energy and high-value materials.	Massive demographic shifts and rapid urbanization, particularly across emerging regions, combined with a surging global demand from the pharmaceutical and animal feed sectors for sustainable biomaterials, unlock extensive, high-value commercial markets. Commercial scaling and the advancement of these systems to high technology readiness levels are actively accelerated by joining forces with academic laboratories specialized in computer vision, 3D modelling, and software engineering. This close institutional cooperation helps industrial partners overcome critical market bottlenecks—such as the global shortage of high-performance GPU hardware and extreme time-to-market pressures—by delivering robust, scientifically validated data and optimized code before deploying physical systems into live operations.
